

LENS SELECTION TEMPLATE For Microfilm ScanPro Film Scanners

You can use this Lens Selection Template to determine the correct lens for your film application. All that is required is this template and the actual film that will be used with the Microfilm ScanPro. The microfilm scanner will scan the entire image that is projected on the view screen. This means that it will scan both landscape images and portrait images if they fit on the view screen. In some cases, depending on how your information was filmed, the image will not be "correct reading" on the view screen. However, when the image is scanned, the software can be set to change the image orientation to be correct reading. For more information on the use of image rotation lenses see: http://e-imagedata.com/Win_Image_Orien.htm

FINDING THE CORRECT LENS: Match the **image outline** on the template to the outside edges of the **image on the film** (you may want to copy this template onto a transparency so you can slide the template over the film image to determine the best match). When you have a match, use the lens Description and Lens Part Number indicated on the template for your order. Note: If you have more than one image size, you will need additional lenses.

6" (152mm)

CAUTION: Faxing and copying may resize these images. Measure these lines, if they do not measure 6" (152mm) as shown, the template images have been resized and can not be used reliably, contact e-ImageData for a lens template by mail.

Image Outline and Description

Lens Ordering Numbers

non-Rotation Lens	Rotation Prism Lens
-------------------	---------------------

<input type="checkbox"/> 54x Lens for 72X Applications	9330054	not available
